

HORIZONTAL MANURE AUGERS

 **McLanahan**[®]
AGRICULTURAL SYSTEMS

mclanahan.com

Horizontal Manure Augers eliminate the need to turn manure out of the barns. Our augers can be integrated with tire scrape and/or alley scrapers. The augers are designed to transfer sand-laden manure into a reception tank or storage. Multiple augers can be installed in a series (push/pull) arrangement.

SPECIFICATIONS

Installation

Auger systems are typically installed at the cross alley in the center or end of the barn. The auger is mounted into a concrete trough specified by McLanahan Corporation. The auger is positioned in the trough so there is no contact between flights and concrete.

Length

Single augers are available in lengths up to 168 feet. Multiple augers can be installed end to end to achieve any length necessary over 168 feet.

Power Requirements

Power requirements vary with auger length. The longer the auger, the more power is required. Single phase and three phase motors are available. McLanahan also offers hydraulically driven systems.

Safety

As an option, McLanahan offers optional grates and plates with each system.
